Rank stability: 36 Collective2 strategies, one month left out

Companion to docs/c2-screen-37.md | 2026-11-10 | every ranking number recomputed from the monthly cells

METHOD

Ranking = annualised return from each strategy's monthly cells, eq^(365/days)-1, days = asOf minus the strategy-began date. For each of the 36 active strategies, one month is removed at a time, the remaining record re-annualised over its actual days, the whole set re-ranked, and the worst place that strategy holds across its own months recorded. Baseline is the published ranking.

HEADLINE

- Median worst place: 4 ranks below the current one. Six of 36 fall 10+ places; the largest drop is 15.
- 25 of 36 touch rank 20 or worse at least once. Four never leave the top 10: 150377786, 141710744, 148705494, 150004796.
- Concentration and rank-dependence agree: the 19 flagged above 70% in the best three months have a median worst drop of 7 places; the other 17, 2 places.
- Worst single-month cases: 153432780 #8 to #23 without 2026-01 (+30.2%); 153416579 #15 to #29 without 2026-03 (+18.3%).

DETAIL (rows sorted by worst place; drop = worst minus baseline, in ranks)

id	n	ann%	base	worst	drop	month out	that mo %	best
134962085	68	15.0	35	36	+1	2021-06	+12.6	33

SCOPE AND LIMITS

One-sided test: removing a positive month can only lower an annualised return, so this measures how much of a place rests on the best month, not symmetric robustness.
Rank runs on annualised return only; ranking by return/drawdown would reorder the set.
146629969 and 150565426 lack begin/asOf dates on the cached page and were annualised by inverting the published annual return.
Set: 37 published ids, one inactive (124293346), 36 active. The leaderboard is a selection - delisted strategies are not measured.
